Earth's Interior Our model of the Earth's interior is based on the study of seismic waves. The Earth has a layered structure because when it formed 4.6 billion years ago, it was mostly melted, allowing more dense materials to sink to the center and lighter materials to float to the surface. It is made of the following layers:

Earthquakes are a sign that the plates which make up the Earth crust are active. An earthquake causes the ground and everything on it to shake. This includes bodies of water such as lakes or oceans, houses, piles of rock, and mud. The shaking can cause other events, such as floods, or fissures, which are cracks in the earth.

Earthquakes : Geology Quiz: Earthquakes Quiz

In the Earth's interior, the shock- or P-waves travel much faster than the S-waves (approx. relation 1.7:1). The differences in travel time from the epicenter to the observatory are a measure of the distance and can be used to image both sources of quakes and structures within the Earth. Also, the depth of the hypocenter can be computed roughly.
